Daily Practice: Ch 7 How do Organisms Reproduce?

Chapter / Topic: How do Organisms Reproduce? · Week 4 of the 90-day plan

Name: _____ Roll No.: _____ Date: _____

Marks obtained: _____

General instructions:

1. One day at a time, about 25 minutes each: Day 1 on the day you study the chapter, then Day 2 and Day 3. Write answers in your notebook and check them with the key the same day. Copy every mistake into your error log.
2. Practise the flower diagram (longitudinal section) on Day 2 until you can label it without looking.

DAY 1: ASEXUAL REPRODUCTION

Q1. Leishmania (which causes kala-azar) reproduces by:

(a) budding
(b) binary fission along a definite plane
(c) multiple fission
(d) fragmentation

Q2. Which plant can grow new plants from buds in the notches along its leaf margins?

(a) Bryophyllum (b) rose
(c) sugarcane (d) banana

Q3. Hydra reproduces asexually by:

(a) binary fission (b) spore formation
(c) budding (d) multiple fission

Q4. In Rhizopus, the spores are produced inside the:

(a) hyphae (b) sporangia
(c) pollen sacs (d) buds

Q5. How are spores able to survive harsh conditions?

Q6. What is tissue culture? Give one advantage of it.

Q7. Describe how Hydra reproduces by budding.

Q8. A potato plant is grown from a piece of potato with an 'eye', and a pea plant is grown from a seed. Which new plant will be more similar to its parent? Explain.

DAY 2: SEXUAL REPRODUCTION IN FLOWERING PLANTS

Q9. The part of a stamen that makes pollen grains is the:

(a) filament (b) style
(c) anther (d) ovary

Q10. Which part of the pistil receives the pollen grains?

(a) stigma (b) style
(c) ovary (d) ovule

Q11. Which of these plants has unisexual flowers?

(a) hibiscus (b) mustard
(c) rose (d) papaya

Q12. In a seed, the part that grows into the future shoot is the:

(a) radicle (b) plumule

(c) cotyledon (d) seed coat

Q13. A pollen grain has landed on a stigma. How does its male germ cell reach the ovule?

Q14. Name three agents of cross-pollination. Give two features of flowers that are pollinated by insects.

Q15. Draw a labelled diagram of the longitudinal section of a flower. Label: sepal, petal, anther, filament, stigma, style, ovary and ovule.

Q16. What does a seed contain? Why is making seeds an advantage for a plant?

DAY 3: HUMAN REPRODUCTION AND REPRODUCTIVE HEALTH

Q17. **Assertion (A):** A human egg is fertilised by many sperms.
Reason (R): Sperms are released in very large numbers.

(a) Both A and R are true, and R is the correct explanation of A.
(b) Both A and R are true, but R is not the correct explanation of A.
(c) A is true, but R is false.
(d) A is false, but R is true.

Q18. The tube that carries sperms from the testis towards the urethra is the:

(a) oviduct (b) ureter
(c) vas deferens (d) fallopian tube

Q19. A Copper-T is placed in the:

(a) vagina (b) ovary
(c) oviduct (d) uterus

Q20. A news report says that in one district, the number of girls born has fallen far below the number of boys. Investigators found that some clinics were illegally telling parents whether their unborn child was a boy or a girl.

(i) What is female foeticide?

(ii) Why has the law banned prenatal sex determination?

(iii) Which parent's germ cell decides whether the child is a boy or a girl? Explain.

Q21. (a) Name, in order, the parts through which sperms travel from where they are made to outside the body.
(b) About how long does a baby take to develop inside the mother, and how is it born?
(c) Give the two functions of the ovaries.

Q22. A woman has had both her oviducts blocked by a surgical method of contraception. Will she still have periods? Can she become pregnant? Explain.

~ Three days, one chapter done. Draw that flower once more before you sleep! ~
